

# Rain forecasts

- Long range seasonal forecast.
  - Tele connections: Enso, Nao.
- Medium-long range forecast (5-10) days.
  - Synoptic maps.
- Medium-close range forecast (2-4) days.
  - Synoptic maps & satellites.
- Immediate forecast – Now casting.
  - Satellite, radar & automatic weather stations.

# Forecasting rain

- Timing.
- Duration.
- Distribution.
- Intensity.
- Quantity.

## Current forecasting limitations

- Accuracy of synoptic weather models.
- Global models are more accurate over Europe & U.S.
- Resolution of 40 k''m. (Global models)
- Resolution of 13 k''m. (Mezzo scale)
- Long intervals between forecasts.

PRECIPITATION FORECAST COMPARISON

**UKMO  
Global**

**DWD  
Global**

**NCEP  
Global**

**IMS  
HRM**

**TAU  
MM5**

\* rain forecast from all models interpolated to grid points with DS=0.25deg

# Precipitation accumulated (1.10.05 - 30.04.06)

## daily forecasts from 06h to 30h

# THE VERIFICATION OF MODELS

EVERY MODEL SHOULD BE VERIFIED BY THREE CRITERIAS:

- **ACCURACY**, BY THE ROOT MEAN SQUARE ERROR -RMSE – (FOR EXAMPLE, THE TEMPERATURE FORECAST SHOULD BE GIVEN WITH AN AVERAGE ACCURACY OF  $\pm 1.5^{\circ}\text{C}$ .
- **SKILL**- SHOWS HOW BETTER THE FORECAST IS COMPARED TO RANDOM HITS OR TO CLIMATOLOGY.
- **VALUE**- REFFERS TO THE ECONOMICAL ADVANTAGE OF THE FORECAST. FOR EXCAMPLE THE VALUE OF REPLACED IRRIGATION.

## WWRP/WGNE Joint Working Group on Verification

C a t e g o r i c a l v e r i f i c a t i o n s				
		Observed		
		yes	no	Total
Forecast	yes	hits	False alarms	Forecast yes
	no	misses	Correct negatives	forecast no
Total		Observed yes	Observed no	total

**Probability of detection (hit rate) -**

$$POD = \text{hits} / (\text{hits} + \text{misses})$$

*Answers the question: What fraction of the observed "yes" events were correctly forecast?*

**Probability of true alarms -**

$$POA = \text{hits} / (\text{hits} + \text{false alarms})$$

*Answers the question: What fraction of the predicted "yes" events actually did occur?*

**Threat score (critical success index)**

$$TS = \text{hits} / (\text{hits} + \text{misses} + \text{false alarms})$$

*Answers the question: How well did the forecast "yes" events correspond to the observed "yes" events?*

**Range: 0 to 1, 0 indicates no skill. Perfect score: 1.**

## Region 7 ( נגב צפוני )

Choice category of forecast for dangerous rain ( $\geq 10\text{mm}$ )

Forecasts  $\geq 10\text{mm}$  6-30h

N (Obs. $>10\text{mm}$ ) = 22	UKMO	DWD	NCEP	HRM	MM5	MIX
hits	5	1	4	9	14	16
misses	17	21	18	13	8	6
False alarms	2	10	1	4	8	11
Probability of detection	0.23	0.05	0.18	0.41	0.64	0.73
Probability of true alarms	0.71	0.5	0.8	0.69	0.64	0.59
Threat score	0.21	0.04	0.17	0.35	0.47	0.48

Forecasts  $\geq 7.5\text{mm}$

N (Obs. $>10\text{mm}$ ) = 22	UKMO	DWD	NCEP	HRM	MM5	MIX
hits	10	1	5	14	17	19
misses	12	21	17	8	5	3
False alarms	3	1	3	6	10	16
Probability of detection	0.45	0.05	0.23	0.64	0.77	0.86
Probability of true alarms	0.77	0.5	0.63	0.7	0.63	0.54
Threat score	0.4	0.04	0.2	0.5	0.53	0.5

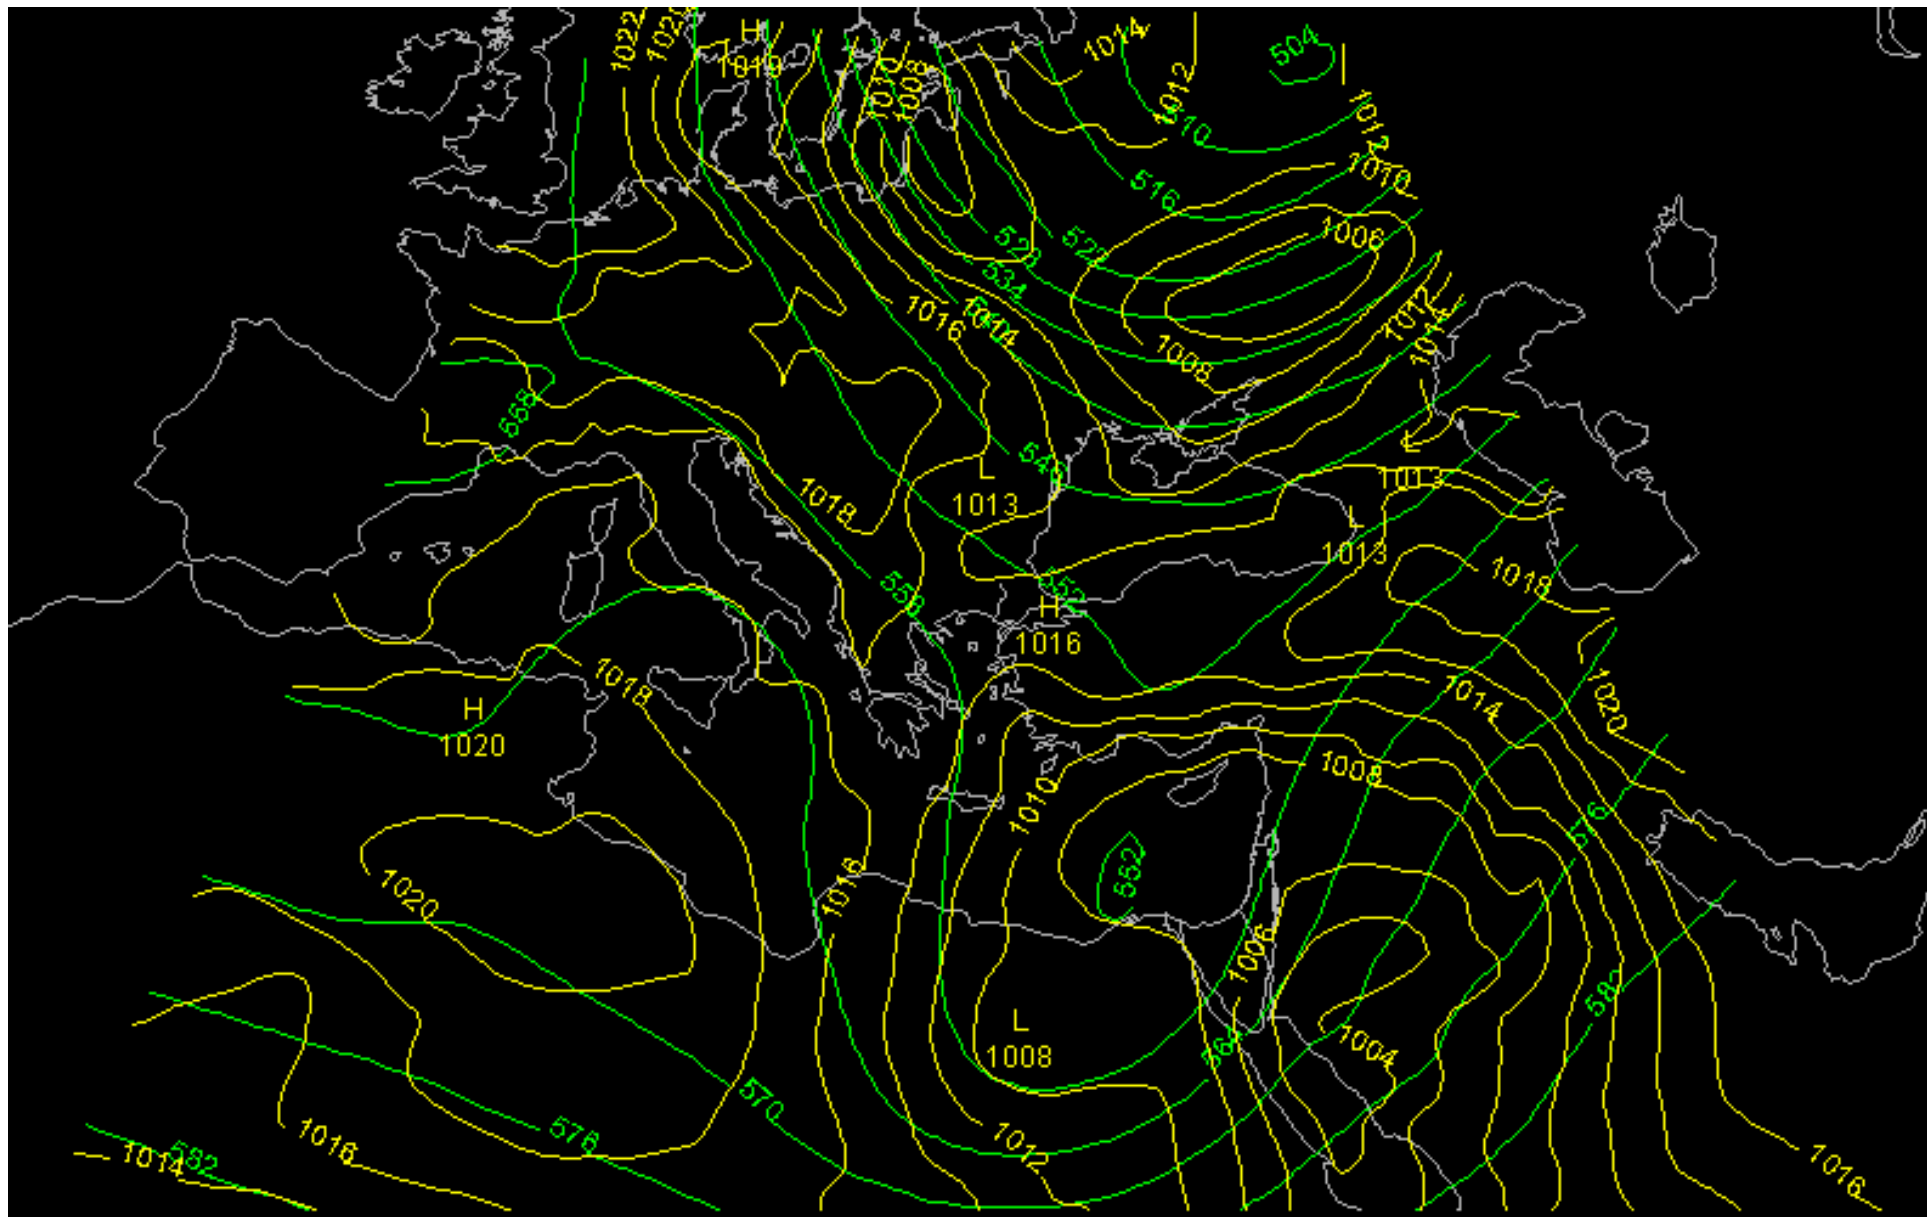

Forecasts  $> 5\text{mm}$

N (Obs. $>10\text{mm}$ ) = 22	UKMO	DWD	NCEP	HRM	MM5	MIX
hits	17	2	12	15	18	21
misses	5	20	10	7	4	1
False alarms	7	2	4	6	14	20
Probability of detection	0.77	0.09	0.55	0.68	0.82	0.95
Probability of true alarms	0.71	0.5	0.75	0.71	0.56	0.51
Threat score	0.59	0.08	0.46	0.54	0.5	0.5

# Current precipitation forecasting criteria

- Analysis of the synoptic conditions- Pressure, temp', R.H, wind.
- Searching for uniformity between the different models.
- Searching for uniformity in the models runs.
- Paying attention to the models rain forecast, knowing its limitations.
- Acquaintance of the different geo climatic zones.
- Experience- Previously forecasting “similar” synoptic conditions.

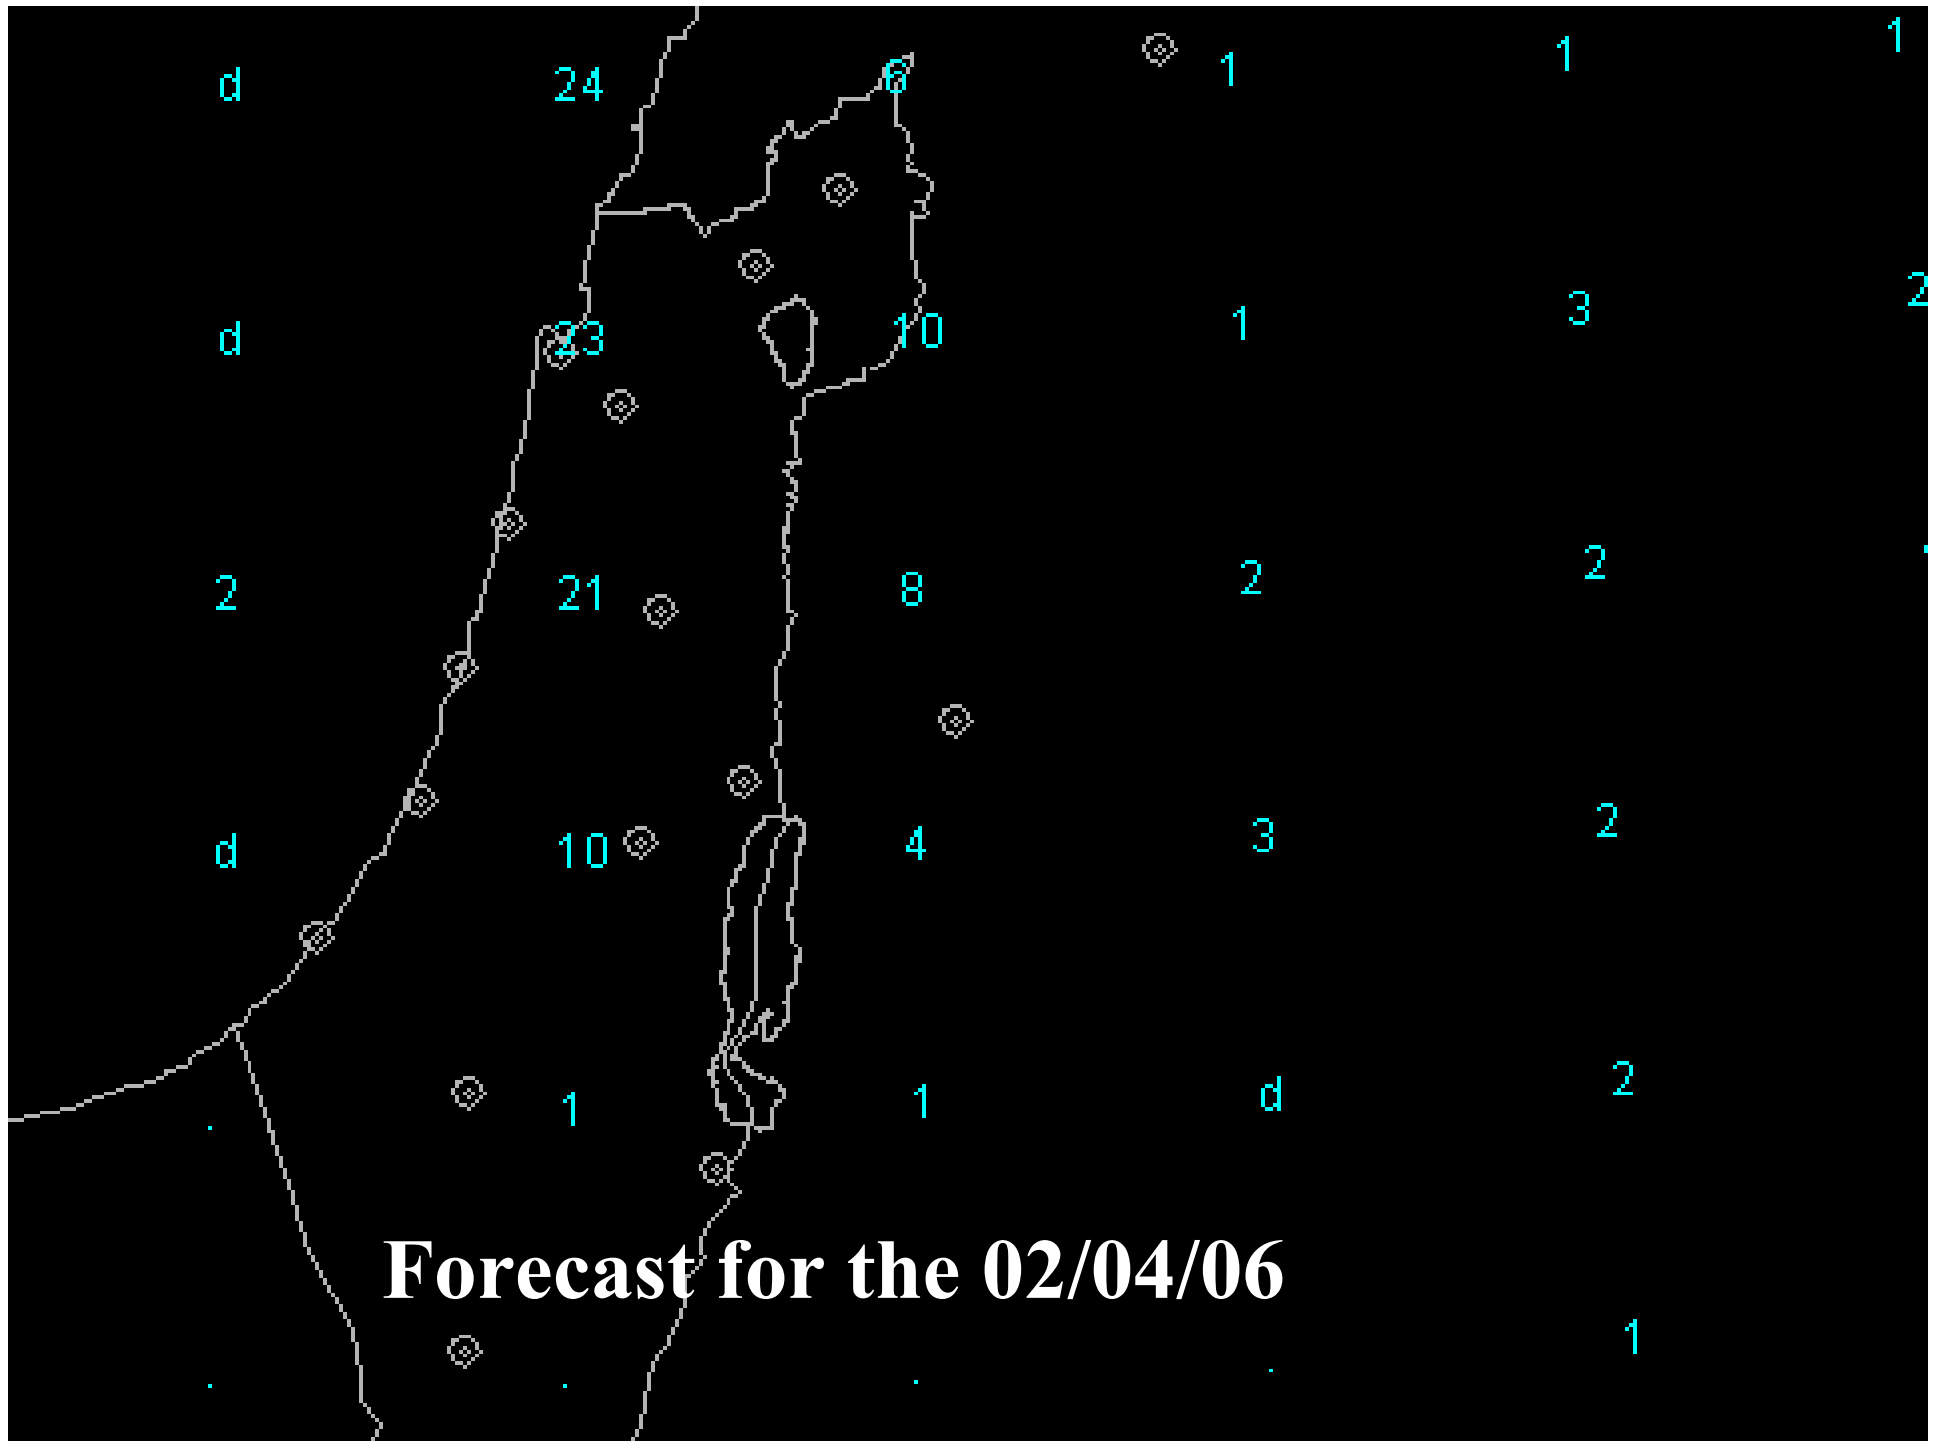

BH HH 500 mb. Actual 03/02 2006 00Z  
BH PP Surface Actual 03/02 2006 00Z

26/04/06 09:03

Rainfall amount - mm

Grey	0.0 - 0.5
Yellow	0.51 - 1.0
Orange	1.01 - 1.5
Green	1.51 - 2.7
Cyan	2.71 - 4.9
Red	4.91 - 12.5
Magenta	12.51 - 24.8
Dark Red	24.81 - 34.9
White	35.00 - 50.0
Brown	> 50.0

# Future requirements in forecasting

- More accurate models.
- Better satellite and radar coverage & resolution.
- A deeper understanding of world pressure oscillations.
- A well developed system of automatic weather stations.
- A modern & efficient forecast distribution system: Internet, Email, cell phone messages and exc'.

# **Future applications in forecasting**

- Long term forecasting ability.
- Pin point precipitation forecasts.
- A computerized data base from stations all around the country accessible to all via the internet.
- Farmers planning their crop selection & work schedule according to the information that is sent to them.
